ENTRAPMENT CATEGORIES

Entrapment in a grain bin is a leading cause of injury or death for farm workers. You can become engulfed in flowing grain in many ways.

Avalanche Entrapment

Can happen when vertically crusted grain becomes dislodged and engulfs the victim (one person died in just 12 inches of corn).

Unloading Entrapment

The most common entrapment, caused when a victim becomes engulfed in flowing grain that is being unloaded from a bin.

Bridging Entrapment

A victim falls through crusted grain into a cavity created as a result of unloading a portion of the grain.

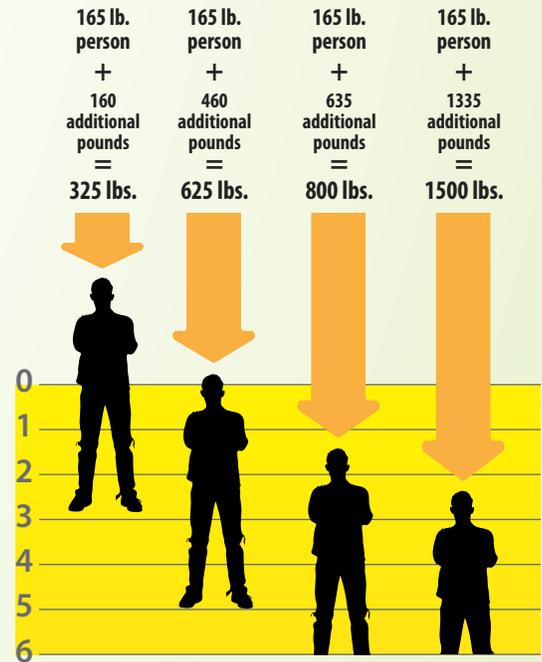

Grain Transport Vehicle (GTV) Entrapment

A danger when the victim becomes engulfed in grain while located in a grain transport vehicle.

VICTIM REMOVAL

The effort required to pull someone from grain is a major hindrance to quick rescue.

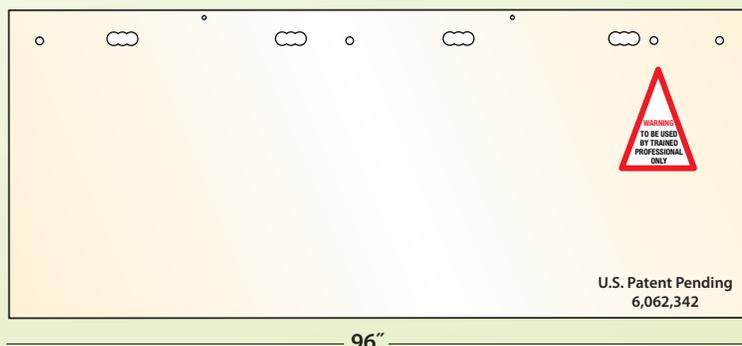

The Turtle Tube® is designed to be used only by trained personnel to extricate a person engulfed in grain.

THINK SAFETY. SAVE LIVES.
